Adding an Icon

With the Images display of the File window, you can access existing system images, as illustrated earlier in this project, or you can create images from data in either **TIFF** (Tag Image File Format) or **EPS** (Encapsulated PostScript) file format. Once you import the image, it can be assigned to Button objects in your application. Figure 0-9 shows some examples of buttons that display icons.

Figure 1-9. Icons and Buttons

To see how this works, click the Images suitcase in the File window to display a variety of icons used in the Application Kit. The titles under the icons are displayed in gray to indicate that these icons can't be deleted nor can their names be edited. However, you can copy and paste any icon that appears in this window.
